LICHEN

Lichen isn't a single organism, but a combination of fungi and algae or cyanobacteria. These organisms exist in a symbiotic, mutually beneficial relationship. The algae or cyanobacteria photosynthesise – producing food via the sun's rays, which feeds the fungus. The fungus gathers nutrients and environmental moisture, passing it back to the algae or cyanobacteria.

Lichen come in many shapes, sizes, forms and colour, are found on surfaces where other organisms struggle to survive, such as rocks, roofs, driveways, asphalt and tree bark. It thrives on tree bark which is exposed to harsh sunlight and rain. It can also be found on plants with sparse foliage, which allow the lichen access to the sun and moisture it needs to grow.

Not always welcome in the garden, they do not actually harm the plants that they grow on. Lichens are a beneficial plant to the ecosystem, they provide food, shelter and nesting material for many bird and animal species.

Lichen do not like pollution so are a sign that the surrounding air is of good quality.

PREVENTION

Regular cleaning of exposed paths, driveways, roofs, or older structures on your property can help keep lichen at bay.

Feed and water plants well, as plant with sparse foliage can provide the ideal environment for lichen.

You can also gently scrub a trees bark to remove lichen with a clean moist rag or loofa, as their 'roots' do not penetrate the bark. Do this with care, as you do not want to take any of the bark off.

TREATMENT ON TREES

In late autumn and winter you can use [Lime Sulphur](#) to remove lichen on **deciduous** trees only. **Do not** use it on evergreens, as they will defoliate (lose their leaves) and will not recover.

Take care if using this product as it can stain paths and fences.

When using sprays and chemicals always read the label and follow instructions carefully. Spray in the evening to avoid harming beneficial insects

TREATMENT ON SURFACES

To control Lichen on hard surfaces such as walls, driveways, paths and roofs use [Yates Surrender](#).

Do not use these products on roofs that have a collection water system.

LICHEN PRODUCT RECOMMENDATIONS

Shop the Kings online store for all your gardening needs

YATES LIME SULPHUR

Lime sulfur. A multi-purpose spray that controls a range of pests and diseases on fruit trees and ornamental plants, and also controls moss and lichen on deciduous plants. Features - low toxic ideal as a winter clean up spray.

YATES SURRENDER

Surrender. A fast acting, easy to use formulation for the control of moss, algae, liverwort and lichen around potted plants, in garden beds, lawns and on paths, roofs and other hard surfaces. Algae will disappear within days,

Everything you need!
